Assignment 6: GLMs (Linear Regressios, ANOVA, & t-tests)

Yuxiang Ren

Spring 2023

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Rename this file `<FirstLast>_A06_GLMs.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change "Student Name" on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure to **answer the questions** in this assignment document.
5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
# 1
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.2 --
## v ggplot2 3.4.1     v purrr   1.0.1
## v tibble  3.1.8     v dplyr   1.1.0
## v tidyr   1.3.0     v stringr 1.5.0
## v readr   2.1.4     v forcats 1.0.0
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

```
library(agricolae)
library(here)
```

```
## here() starts at /Users/min/Desktop/EDA-Spring2023/R/EDA
```

```
library(ggplot2)
library(lubridate)
```

```
##
## Attaching package: 'lubridate'
##
## The following objects are masked from 'package:base':
##
##     date, intersect, setdiff, union
```

```
here()  #verify home directory
```

```
## [1] "/Users/min/Desktop/EDA-Spring2023/R/EDA"
```

```
# raw data
Lake <- read.csv("./Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv", stringsAsFactors = T)

Lake$sampledate <- mdy(Lake$sampledate)

# 2
mytheme <- theme_bw(base_size = 14) + theme(axis.text = element_text(size = 11, color = "black"),
    axis.title = element_text(size = 13, color = "black"), legend.title = element_text(size = 13,
        color = "black"))
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: Mean lake temperature recorded during July not change with depth across all lakes. Ha: Mean lake temperature recorded during July change with depth across all lakes.

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

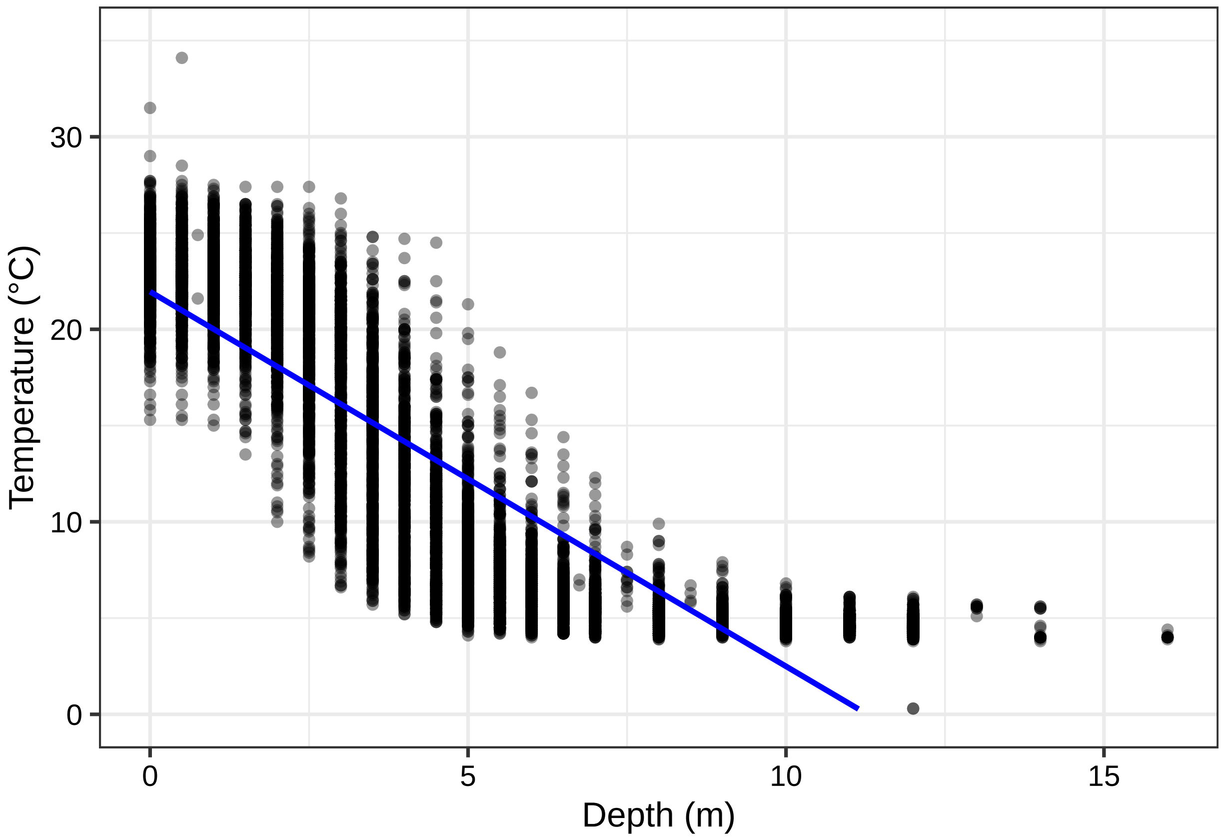
5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

```
# 4
Lake_temperature_depth <- Lake %>%
    filter(month(sampledate) == 7) %>%
    select(lakename, year4, daynum, depth, temperature_C) %>%
    drop_na()
```

```r
# 5
ggplot(Lake_temperature_depth, aes(x = depth, y = temperature_C)) + geom_point(alpha = 0.4) +
    geom_smooth(method = "lm", col = "blue", se = FALSE) + labs(x = "Depth (m)",
    y = "Temperature (°C)") + ylim(0, 35) + mytheme
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values (`geom_smooth()`).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

   Answer: The scatter plot with the smoothed line suggests that there is a negative relationship between temperature and depth in the NTL-LTER lakes during July. As depth increases, the temperature tends to decrease. The distribution of points suggests that the relationship may not be perfectly linear. There appears to be a curvature to the relationship, with temperature decreasing more rapidly at shallower depths and the rate of decrease gradually levelling off as depth increases.

7. Perform a linear regression to test the relationship and display the results

```r
# 7
lm_t_d <- lm(temperature_C ~ depth, data = Lake_temperature_depth)
summary(lm_t_d)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = Lake_temperature_depth)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 21.95597    0.06792   323.3   <2e-16 ***
## depth       -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: The R-squared value of the linear regression model is 0.7387, which means that approximately 73.87% of the variability in temperature during July in the NTL-LTER lakes is explained by changes in depth. The degree of freedom for the linear regression model is 9726, which reflects the number of data points (9728) minus the number of estimated coefficients (2). This estimate of the relationship between depth and temperature is statistically significant, with a t-value of -165.8 and a p-value of <2e-16, indicating that the probability of observing such a strong relationship by chance is very low. The result estimates that the mean temperature in the NTL-LTER lakes during July decreases by 1.94621 C for every 1-meter increase in depth.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```
# 9
year_day_dep_model <- lm(data = Lake_temperature_depth, temperature_C ~ year4 + daynum +
    depth)
step(year_day_dep_model)
```

```
## Start:  AIC=26065.53
## temperature_C ~ year4 + daynum + depth
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = Lake_temperature_depth)
##
## Coefficients:
## (Intercept)        year4       daynum        depth
##    -8.57556      0.01134      0.03978     -1.94644
```

```
# 10
recommended_model <- lm(data = Lake_temperature_depth, temperature_C ~ year4 + daynum +
    depth)
summary(recommended_model)
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = Lake_temperature_depth)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The final set of explanatory variables includes year4, daynum and depth. They could explain approximately 74% of the observed variance. This multiple regression model is an improvement over the simple linear regression model due to having a lower AIC value and could explain more observed variance.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
# 12 ANOVA model
Anova_Lake_T_name <- aov(temperature_C ~ lakename, data = Lake_temperature_depth)
summary(Anova_Lake_T_name)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename       8  21642  2705.2      50 <2e-16 ***
## Residuals   9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
# Linear model
Lm_Lake_T_name <- lm(temperature_C ~ lakename, data = Lake_temperature_depth)
summary(Lm_Lake_T_name)
```

```
##
## Call:
## lm(formula = temperature_C ~ lakename, data = Lake_temperature_depth)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -10.769  -6.614  -2.679   7.684  23.832
##
## Coefficients:
##                          Estimate Std. Error t value Pr(>|t|)

##
## Residual standard error: 7.355 on 9719 degrees of freedom
## Multiple R-squared:  0.03953,    Adjusted R-squared:  0.03874
## F-statistic:    50 on 8 and 9719 DF,  p-value: < 2.2e-16
```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

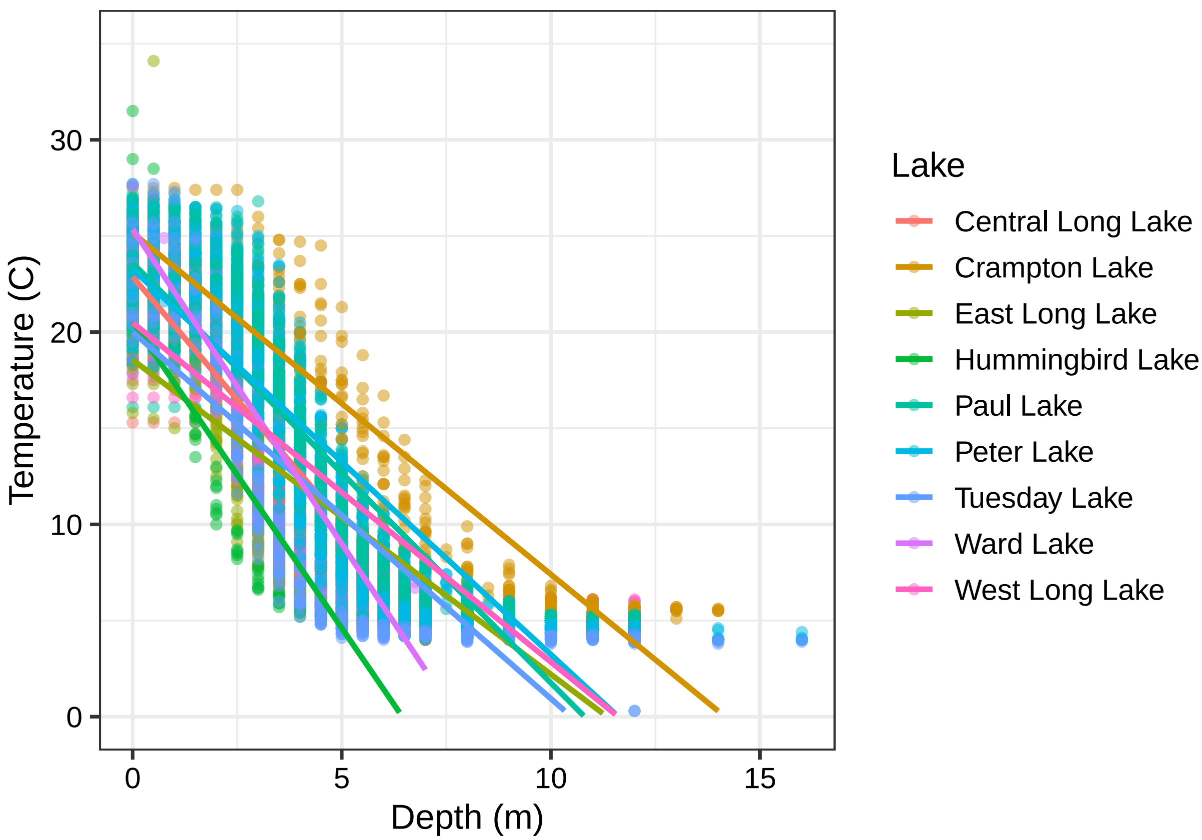
    Answer: Yes, there is a significant difference in mean temperature among the lakes. First, the ANOVA model shows that the mean temperature in July varies significantly among the lakes. Second, the linear model shows that different lakes have different and significant intercepts and coefficients, which also indicates there is a significant difference in mean temperature among the lakes.

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
# 14.
Plot_14 <- ggplot(Lake_temperature_depth, aes(x = depth, y = temperature_C, color = lakename)) +
    geom_point(alpha = 0.5) + geom_smooth(method = "lm", se = FALSE) + ylim(0, 35) +
    labs(x = "Depth (m)", y = "Temperature (C)", color = "Lake") + mytheme
print(Plot_14)
```

```
## `geom_smooth()` using formula = 'y ~ x'

## Warning: Removed 73 rows containing missing values (`geom_smooth()`).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
# 15
Tukey_Lake_T_name <- TukeyHSD(Anova_Lake_T_name)
Tukey_Lake_T_name
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = Lake_temperature_depth)
```

```
##
## $lakename
##                                          diff        lwr        upr     p adj

```

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: The mean temperature of Paul Lake might be the same as Lake Peter, with a confidence interval including zero. However, it's p-value is too high, making the result insignificant. There is no lake have a mean temperature that is statistically distinct from all the other lakes. Central Long Lake is different from most lakes but might be same as Crampton Lake due to it's confidence interval includiing zero.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

> Answer: Two-sample t-test

18. Wrangle the July data to include only records for Crampton Lake and Ward Lake. Run the two-sample T-test on these data to determine whether their July temperature are same or different. What does the test say? Are the mean temperatures for the lakes equal? Does that match you answer for part 16?

```
Crampton_Ward <- filter(Lake_temperature_depth, lakename %in% c("Crampton Lake",
    "Ward Lake"))
t_test_Crampton_Ward <- t.test(temperature_C ~ lakename, data = Crampton_Ward)
t_test_Crampton_Ward
```

```
##
##  Welch Two Sample t-test
##
## data:  temperature_C by lakename
## t = 1.1181, df = 200.37, p-value = 0.2649
## alternative hypothesis: true difference in means between group Crampton Lake and group Ward Lake is r
## 95 percent confidence interval:
##  -0.6821129  2.4686451
## sample estimates:
## mean in group Crampton Lake     mean in group Ward Lake
##                    15.35189                    14.45862
```

Answer: The T-test shows that the estimated mean temperatures for the two lakes are different. However, due to the p-value > 0.05, it can not reject the null hypothesis that the mean temperatures for the two lakes are equal. Therefore, there is no statistically significant difference in mean temperature between Crampton Lake and Ward Lake in July.
